STIC-Biotech/ChemLib Sequence Database Search Request 09/888,326

SEARCH REQUEST FORM Scientific and Technical Information Center

Examiner# : 78697 Art Unit : 1635

Phone Number: 571-272-0756

Date: 7/26/05

Serial Number: 09/888,326 (Weiner, G. et al.) Mailbox & Bldg/Room Location: REMSEN 2C18

Results Format Preferred (circle): Paper

I would like to have a <u>standard and interference</u> search performed using the following SEQ. ID NO. from application: 09/888,326

SEQ ID NO: 729 (nucleic acid ~25 nucleotides long)

Please perform standard and oligomer search of the commercial and pending nucleic acid databases using SEQ ID NO: 729

you can contact me by telephone or email if you have any questions.

Thanks, Eric

Oligonucleotides containing at least 1 unmethylated CpG dinucleotide affect the immune response in a subject by activating natural killer cells or redirecting a subject's immune response from a Th2 to a Th1 response by inducing monocytic and other cells to produce Th1 cytokines. These nucleic acids containing at least 1 unmethylated CpG can be used as an adjuvant, specifically to induce an immune response against an

dinucleotide - encoding antigen

treating air flow Use of nucleic acids containing an unmethylated CpG - for subject having or at risk of having an acute decrement in inhibiting an inflammatory response.

English Disclosure; Page 13; 65pp;

This sequence represents an unmethylated CpG dinucleotide, and can be used in the method of the invention. The method is for treating a subject having, or at risk of having an acute decrement in air flow, comprising administering a nucleic acid sequence containing at least one dinucleotide affect an immune response in a subject by activating natural killer cells (NK) or redirecting a subject's immune response from a Th2 to a Th1 response by inducing monocytic and other cells to produce Th1 cytokines. They can be used to treat pulmonary disorders having an immunologic component, such as asthma or environmentally induced airway disease. They can also be used to treat diseases associated with Grampositive bacterial infections or endotoxaemia including bacterial constitute prenumnia, inflammatory bowel disease and liver cirrhosis, Gram-negative pneumonia, Gram-negative abdominal abscess, haemorrhagic shock, disseminated intravascular coagulation, or an inflammatory response to lipopolysaccharide

of the invention. The ODNs contain at least one unmethylated CpG
dinucleotide, and have the formula: 5' NIXICGX2N2 3', where at least one
dinucleotide separates consecutive CpGs, X1 is adenine, guanine, or
thymine, X2 is cytosine or thymine, N is any nucleotide and N1+N2 is 0-26
bases with the provision that N1 and N2 does not contain a CCGG tetramer
or more than one CCG or CGG trimer OR 5' NXIX2CGX3X4N 3', where at least
one nucleotide separates consecutive CpGs, X1 and X2 are selected from
GpT, GpG, GpA, ApT and ApA, X3and X4 are selected from TpT or CpT, N is
any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2
does not contain a CCGG tetramer or more than one CCG or CGG trimer. The
CDNs activate lymphocytes in a subject and redirect a subject's immune
cells to produce Th1 cytokines, including IL-12, IFN-gamma and GM-CSF).
The ODNs can be used to treat or prevent an asthmatic disorder,
autoimmune diseases, in desensitisation therapy, as an artificial
adjuvant during antibody generation in a mammal such as a mouse or a

Sequences AAZ41856-Z41949 are phosphorothioate CDG oligonucleotides which are used in the invention to induce interleukin-12 (IL-12) secretion from human PBMC. The invention comprises stimulating an immune response in a subject comprising administering to a subject exposed to an antigen, an immunopotentiating cytokine and an immunostimulatory CpG oligonucleotide to induce a synergistic antigen specific immune response. The methods are useful for treating cancer by stimulating an antigen specific immune response against a cancer antigen. The methods can also be used to treat neoplastic disorders in humans, including but not limited to: sarcoma, carcinoma, fibroma, Lymphoma, melanoma, neuroblastoma, retinoblastoma, and glioma. The methods are also useful for treating infectious diseases.

Carcinoma, fibroma, Lymphoma, melanoma, neuroblastoma, retinoblastoma, and glioma. The methods and compositions may also be used to treat allergic diseases, e.g. asthma. The methods may also be used to treat allergic diseases, e.g. asthma. The methods may also be used to treat and include leukaemia, haemangiopericytoma and bovine ocular neoplasia. Chronic, infectious, contegious diseases of sheep and goats caused by the bacterium corpusations hay also be treated and include leukaemia, haemangiopericytoma and bovine ocular neoplasia. Chronic, infectious, contegious diseases of sheep and goats caused by the bacterium pseudotuberculosis, and contagious lung tumour of sheep caused by jaagsiekte may also be treated. CpG oligonucleotides enhance antibody such as monocytes and macrophages. CpG oligonucleotides enhance antibody dependent cellular cytotoxicity and can be used as an adjuvant in

The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (C-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used fexpression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines, apoptotic proteins, interferons, hormone clotting factors, ligands and receptors. The method involves determining the CpG-N and CpG-S motifs present in the construct removing neutralising CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines apoptotic proteins, interferons, hormones, clotting factors, ligands ar receptors. AAZ60933-Z61015 represent immunostimulatory stereoisomers of CpG oligonucleotides. The sequences are derived from generic nucleic acid sequence, from which immunoinhibitory sequences may also be derived. The immunostimulatory nucleic acids can be co-administered with an antigen to induce an antigen-specific immune response. The immunostimulatory nucleic acids can also be used in methods for redirecting a subject's immune cesponse from a Th2 to a Th1, for treating asthma, for desensitising a subject against the occurrence of an allergic reaction in response to contact with an allergen, for activating an immune cell, especially a lymphocyte or a dendritic cell expressing a cancer antigen or for treating cancer. The immunoinhibitory nucleic acid can be used to prevent an immune response, especially where the immune response in the subject are immunoinhibitory nucleic acid can be used to treat a subject having or at immune disease, gingivitis, psoriasis and sepsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Haematopoiesis; regulation; CpG oligonucleotide; phosphorothioate; immune remodeling; thrombopoiesis; anaemia; immune system; cancer; immune response; allergic reaction; infectious disease; asthma; thrombocytopaenia; immunohaemolytic disorder; genetic disorder; haemoglobinopathy; kidney failure; chronic inflammatory disorder; rheumatoid arthritis; ss.

The present invention describes a method using CpG containing oligonucleotides (ONS) for regulating immune system remodeling and for regulating haematopoiesis. The method for inducing an antigen-specific immune response comprises: (1) administering an ON having a sequence including at least the formula (1); and (2) exposing the subject to an antigen specific immune response: 5° XICGX2 3° (1), where the produce an antigen specific immune response: 5° XICGX2 3° (1), where the constitution of a includes at least 8 mucleotides; C and G = unmethylated, and X1 and X2 = nucleotides. The method can be used for inducing an immune response against an antigen such as cells, cell extracts, proteins, polysaccharides, polysaccharides, polysaccharides, polysaccharides, polysaccharides, virales, bacteria, fungi, parasites and allergens. It can be used in subject at risk of developing cancer or an allergens. It can also be used for treating an infectious disease, allergic reaction. It can also be used for treating an infectious disease, allergic reaction. It can also be used for treating an infectious cardation exposure. It can also be used for treating an infectious is drug-induced, due to an autoimmune disorder such as idiopathic radiation exposure. It can also be used for treating anaemia such as drug radiation exposure. It can also be used for treating anaemia such as drug conduction edespite adequate iron stores, chronic disease such as kidney failure, and charaquetic radiation exposure. Axiangos resulting from accidental or therapeutic radiation exposure. Axiangos resulting from accidental or therapeutic radiation exposure. Axiangos resulting exemplification of the present invention

The present invention describes a method using CpG containing oligonucleotides (ONS) as adjuvants for inducing an immune response. The method for inducing a mucosal immune response (MIR) comprises: (1)

administering to a mucosal immune response (MIR) comprises: (1)

can including at least the formula (I); and (2) exposing the subject to an antigen to induce the MIR, where the antigen is not encoded in a nucleic acid vector: 5'XIXZCGX3X43' (I), where C and G = unmethylated, and X1,

X2, X3 and X4 = nucleotides. The method can be used for treating a subject at risk of developing an allergic reaction, cancer or infectious disease. It can be used for treating asthmatic subjects, eczema, allergic rhinitis or coryza, hay fever, conjunctivitis, bronchial asthma,

C urticaria, food allergies or other atopic conditions. The antigen may be derived from infectious organisms such as infectious bacteria, viruses, parsaites or fungi. It can be used in humans or animals, e.g. bovine, caucosal adjuvants to induce immune responses at both local and remote sites against an antigen administered to the mucosal tissue. Both systemic and mucosal immunity are induced by mucosal delivery of the ONS.

AAZ47808 to AAZ47891 represent examples of immunostimulatory of the ONS.

Oligonucleotides given in the constant constant constants.
                                                                                                                                                                                                                                       containing oligonucleotides as adjuvants for inducing an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CpG; immunostimulatory; adjuvant; vaccine; metal salt; antiviral; antibacterial; antiprotozoal; antimalarial; anti-allergic; anticancer; immune response; infection; allergy; cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IndelB

The present invention describes an adjuvant composition (A) comprising an immunostimulant (I) absorbed on a metallic salt particle (II) that is practically free of antigen (Ag). Also described are: (1) preparation of a vaccine by mixing (A) with Ag; (2) vaccine comprising two major populations of complexes, one comprising (A) and the other Ag adsorbed on (II); and (3) kit comprising, in separate containers, monophosphoryl lipid A (MPL) adsorbed on metal salt and Ag adsorbed on metal salt. (A) has antiviral, antibacterial, antiprotozoal, antimalarial, anti-allergic and anticancer activities, and can be used to induce a specific immune response. (A) are used in preparation of vaccines for treatment or prevention of a wide range of viral, bacterial and protozoal infections, also allergy and cancers. By adsorbing (I) and Ag on separate particles, vaccines (including those containing many Ag) can be produced simply by mixing, rather than by sequential adsorption of many components on to the same particles (which is time-consuming, expensive and difficult to control). The component may be tested individually and failure of any one component does not require rejection of an entire batch of vaccine. The new vaccines are as effective as those prepared conventionally. The present sequence represents a CpG immunostimulatory oligonucleotide which is used in the exemplification of the present invention

The present invention describes a method for treating and preventing parasitic infection by administration of unmethylated CpG oligonucleotides are able to stimulate the innate immune system via the activation of immune cells, such as antigen presenting cells, natural killer cells and granulocytes. The CpG oligonucleotides and the method can be used to treat and prevent parasitic diseases, such as malaria, helminth diseases, tick and mites in humans, animals and poultry. The oligonucleotides may be administered in conjunction with parasiticides or other therapeutic compounds after an conjunction with parasiticides or other therapeutic compounds after an conjunction with parasiticides or other therapeutic subseases which can be treated or prevented include those caused by plasmodium falciparum, P. ovale, P. malariae, P. vivax, P. knowlesi, Babbesia microti, B. divergens, Trypanosoma cruzi, T. gambiense, T. rhodesiense, Schistosoma mansoni, Toxoplasma gondii, Trichinella spiralis, Leishmania major, L. donovani, L. braziliensis, and L. tropica. The parasite is especially capable of causing malaria. The present sequence represents a parasitic infection preventing exemplary oligonucleotide sequence from the present invention
                                                                                                                                                                                                                                                                                                     which

not ; acid, which of these The present sequence represents an immune stimulatory nucleic acid, which is included in the particles of the invention. The structure of these particles is based in part on duck hepatitis B viral core antigen (HBcAg). The particles are used for hapten presentation so as to elicit an immune response. The particles are formed by assembling recombinant forms of duck HBcAg, and are highly immunmogenic. Native duck HBcAg particles are 32-34 nm particles composed of 240 identical subunit monomers, and are very similar to human HBcAg. However, duck HBcAg is not cross-reactive with human HBcAg. Recombinant forms of duck hepatitis B virus elicit a TH1 (T helper cell) immune response. The duck HBcAg particles are used to elicit an immune response in a patient.

The present sequence represents an immune stimulatory nucleic acid, which is included in the particles of the invention. The structure of these particles is based in part on duck hepatitis B viral core antigen (HBcAg). The particles are used for hapten presentation so as to elicit an immune response. The particles are formed by assembling recombinant forms of duck HBcAg, and are highly immunmogenic. Native duck HBcAg particles are 32-34 nm particles composed of 240 identical subunit irus, response comprises duck hepatitis B v A composition useful for inducing an immune nucleocapsid protein monomers, derived from are assembled to form a particle. A vaccine composition containing the adjuvant is useful for inducing an immune response in an individual and for preventing or treating disease. Diseases include cancers; allergy; Alzheimer's disease and atherosclerosis. The vaccine is also useful for prophylaxis and treatment of viral, bacterial and parasitic infections. The present sequence is an oligonucleotide of the invention
                                                                                                                                                                                              s disease;

Sequence 84, Application US/09191170

Patent No. 6429199

GENERAL INFORMATION:

APPLICANT: Krieg, Arthur M.

APPLICANT: Hartmann, Gunther

TITLE OF INVENTION: Immunostimulatory Nucleic Acid Molecules

FILE REFERENCE: C1039/7017

CURRENT APPLICATION NUMBER: US/09/191,170

CURRENT FILING DATE: 1998-11-13

EARLIER FILING DATE: 1997-10-30

EARLIER PILING DATE: 1996-10-30

EARLIER FILING DATE: 1996-10-30

EARLIER FILING DATE: 1996-07-15

EARLIER FILING DATE: 1994-07-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 24;
                                                                                            RESULT 6
US-09-325-193A-77
; Sequence 77, Application US/09325193A
; Patent No. 6406705
; GENERAL INFORMATION:
; APPLICANT: Davis, Heather L.
; APPLICANT: Schorr, Joachim
; APPLICANT: Krieg, Arthur M.
; TITLE OF INVENTION: Use of Nucleic Acids Containing
; TITLE OF INVENTION: Unmethylated CpG Dinucleotide as an
; FILE REFERENCE: C1039/7025/HCL

US-09-191-170-95

i Sequence 95, Application US/09191170

i Patent No. 6429199

i GENERAL INFORMATION:

APPLICANT: Hartmann, Gunther

TITLE OF INVENTION: Immunostimulatory Nucleic Acid Molecules

TITLE OF INVENTION: for Activating Dendritic Cells

TITLE OF INVENTION: for Activating Dendritic Cells

FILE REFERENCE: C1039/7017

CURRENT APPLICATION NUMBER: US/09/191,170

CURRENT FILING DATE: 1998-11-13

EARLIER FILING DATE: 1998-11-13

EARLIER FILING DATE: 1997-10-30

EARLIER FILING DATE: 1996-10-30

EARLIER FILING DATE: 1996-2-07

EARLIER FILING DATE: 1995-02-07

EARLIER FILING DATE: 1994-07-15

NUMBER OF SEQ ID NOS: 99

NUMBER OF SEQ ID NOS: 99

NUMBER OF SEQ FOR Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 24;

Sequence 6, Application US/09965101

Patent No. 6821957

GENERAL INFORMATION:

APPLICANT: Davis, Heather L.

APPLICANT: Krieg, Arthur M.

APPLICANT: Schorr, Joachim

APPLICANT: Wu, Tong

TITLE OF INVENTION: Therapeutic Protocols

CURRENT APPLICATION NUMBER: US/09/965,101

CURRENT APPLICATION NUMBER: US 09/082,649

PRIOR FILING DATE: 1998-05-20

PRIOR FILING DATE: 1997-05-20

PRIOR FILING DATE: 1997-05-20

PRIOR FILING DATE: 1997-05-20

NUMBER OF SEQ ID NOS: 84

SOFTWARE: FASELSEQ for Windows Version 3.0
                                 Immunization
                                                                                                                                                                                                                                                                                                                                                                         FEATURE:

COTHER INFORMATION: synthetic oligonucleotide

NAME/KEY: misc_feature

LOCATION: (0)...(0)

COTHER INFORMATION: Has a phosphorothioate backbone

/note="VGctor: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (female) was obtained from the Jackson Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonacleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: pBluescript II KS(+); Site_1: EcoRI;
Site_2: Not1; This normalized library was constructed from 1 million independent clones. cDNA synthesis was initiated using an oligo(dT) primer, using methylated C in the first strand synthesis reaction. Following this first strand reaction, double-stranded cDNA was blunted, ligated to NotI adapters, digested with EcoRI, size-selected, and cloned into the NotI and EcoRI compatible sites of a custom modified MCS of the pBluescript (KS+) vector. The library was normalized in 2 rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1996): 791, except that a significantly longer reannealing hybridization was
    Burt, D.W., Bosch, E., and Hubbard, S.J.
